

Session 09 Teamwork — Close the Same Gap in Workspaces

Context

Work in your team (six teams of four students). The instructor's own `ProjectsModule` just closed a real bug: `name / key` are now trimmed with `@Transform()` before validation, and `UpdateProjectDto` no longer duplicates `CreateProjectDto`'s rules — it inherits them via `extends PartialType(CreateProjectDto)`. Your job is to apply the exact same fix, independently, to `Workspaces`.

Goal

`CreateWorkspaceDto / UpdateWorkspaceDto` reach the same end state as `Projects`' own DTOs — reasoned through by your team, not copied and renamed from `projects/dto/*.ts`.

What to build

- `CreateWorkspaceDto` (in `src/workspaces/dto/create-workspace.dto.ts`): add `@Transform(({ value }) => value.trim())` to `name` and `slug`, in the same position (`@IsString()` → `@Transform()` → `@IsNotEmpty()`) the instructor just used on `CreateProjectDto`. Go straight here — don't add the fix to `UpdateWorkspaceDto` first; the next step derives `Update` FROM `Create`.
- `UpdateWorkspaceDto` (in `src/workspaces/dto/update-workspace.dto.ts`): delete the whole hand-written class body — imports and all three duplicated fields — and make it extend the same `PartialType(...)` of `CreateWorkspaceDto` the instructor just built for `UpdateProjectDto` in class, importing `PartialType` from `@nestjs/mapped-types` (already installed) and `CreateWorkspaceDto` from its own file. The resulting class body should be empty.

Rules

Allowed: everything the instructor just used for `Projects` — `@Transform()` from `class-transformer`, `PartialType()` from `@nestjs/mapped-types` (already installed, nothing new to install).

Not yet: no `PickType / OmitType` (that was FLEX discussion only), no new `ValidationPipe` options, no guards, no database, no `description trim` (that is next session's own homework).

Test it

BASH

```
curl -X POST http://localhost:3000/workspaces -H "Content-Type: application/json" -d
'{"name": "   ", "slug": "ws-test", "description": "test"}'
curl -X PATCH http://localhost:3000/workspaces/1 -H "Content-Type: application/json" -d
'{"name": "   "}'
curl -X PATCH http://localhost:3000/workspaces/1 -H "Content-Type: application/json" -d
'{"name": "Acme Robotics Inc."}'
curl -X PATCH http://localhost:3000/workspaces/1 -H "Content-Type: application/json" -d
'{"slug": "nova-labs"}'
```

Done when

- `POST /workspaces` with a whitespace-only `name` returns `400`, not `201` — the bug is closed.
- `PATCH /workspaces/:id` with a whitespace-only `name` still correctly returns `400` (now inherited from `CreateWorkspaceDto`, not its own separate rule).
- `PATCH /workspaces/:id` with a real name change still works, trimmed.
- `PATCH /workspaces/:id` with a `slug` that collides with another workspace still returns `409` — the one business rule that stayed in the service, untouched by any of this.
- Every team member can point at `UpdateWorkspaceDto`'s own file and explain why it no longer has any decorators of its own.

Working time

Around 20 minutes — this is a smaller, focused refactor of DTOs you already have, not building new ones from scratch.
